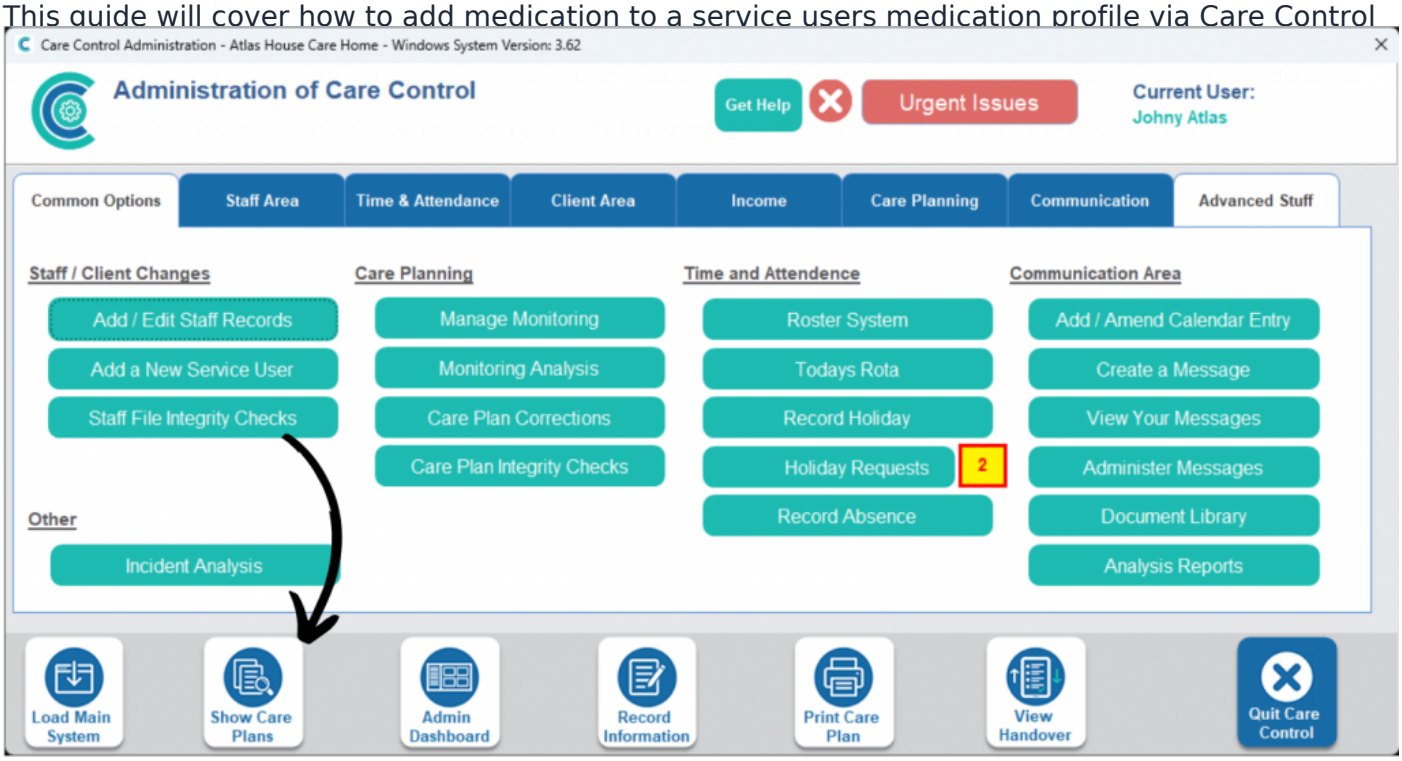
Adding Medication to the Medication Profile

Care Plans Windows · https://cclearninghub.co.uk/docs/adding-medication-to-the-medication-profile/

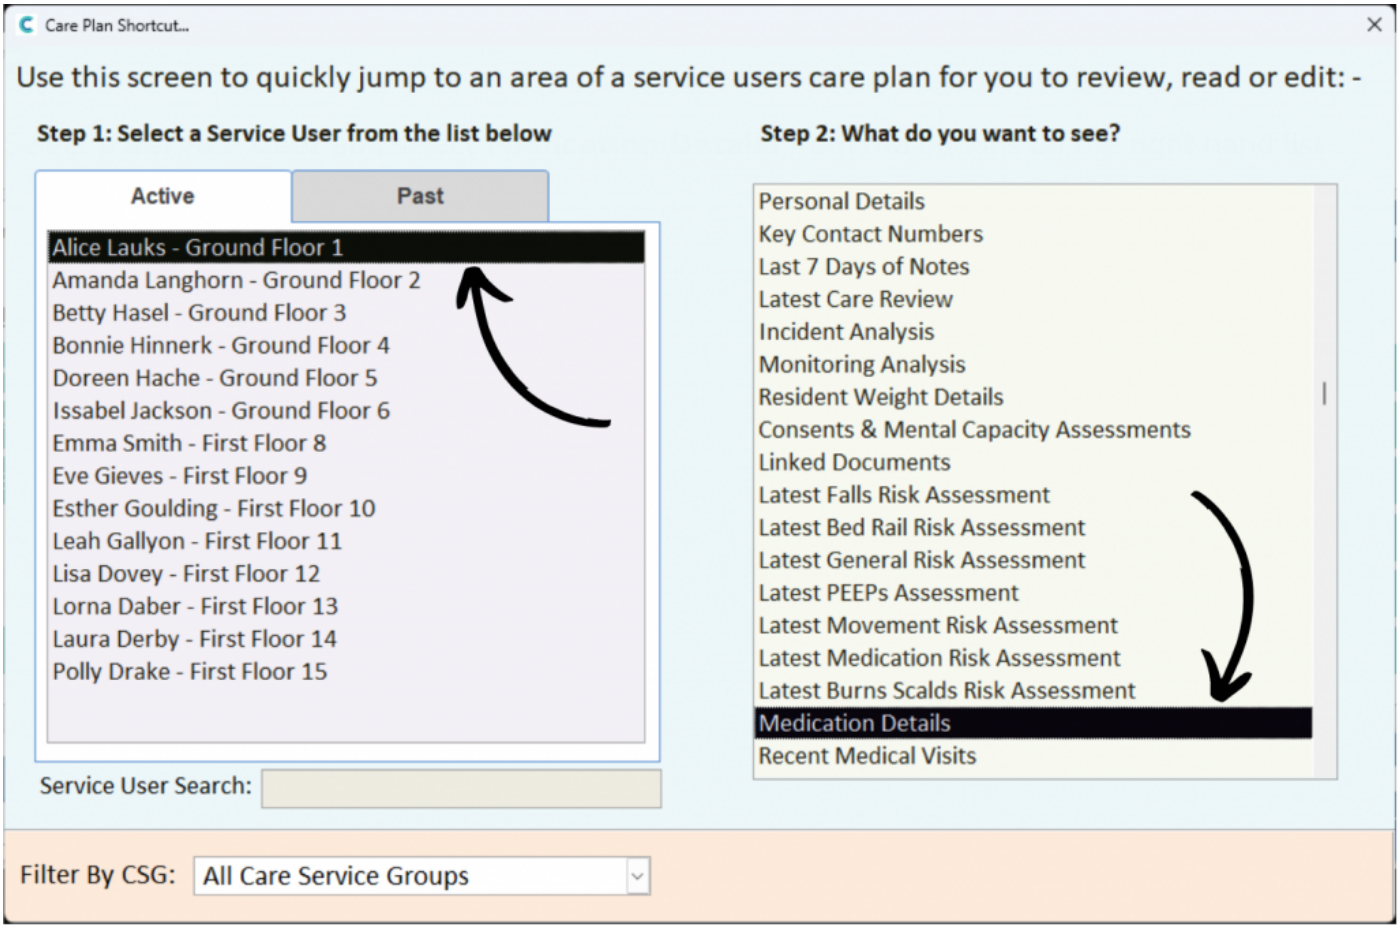
Adding Medication to the Medication Profile

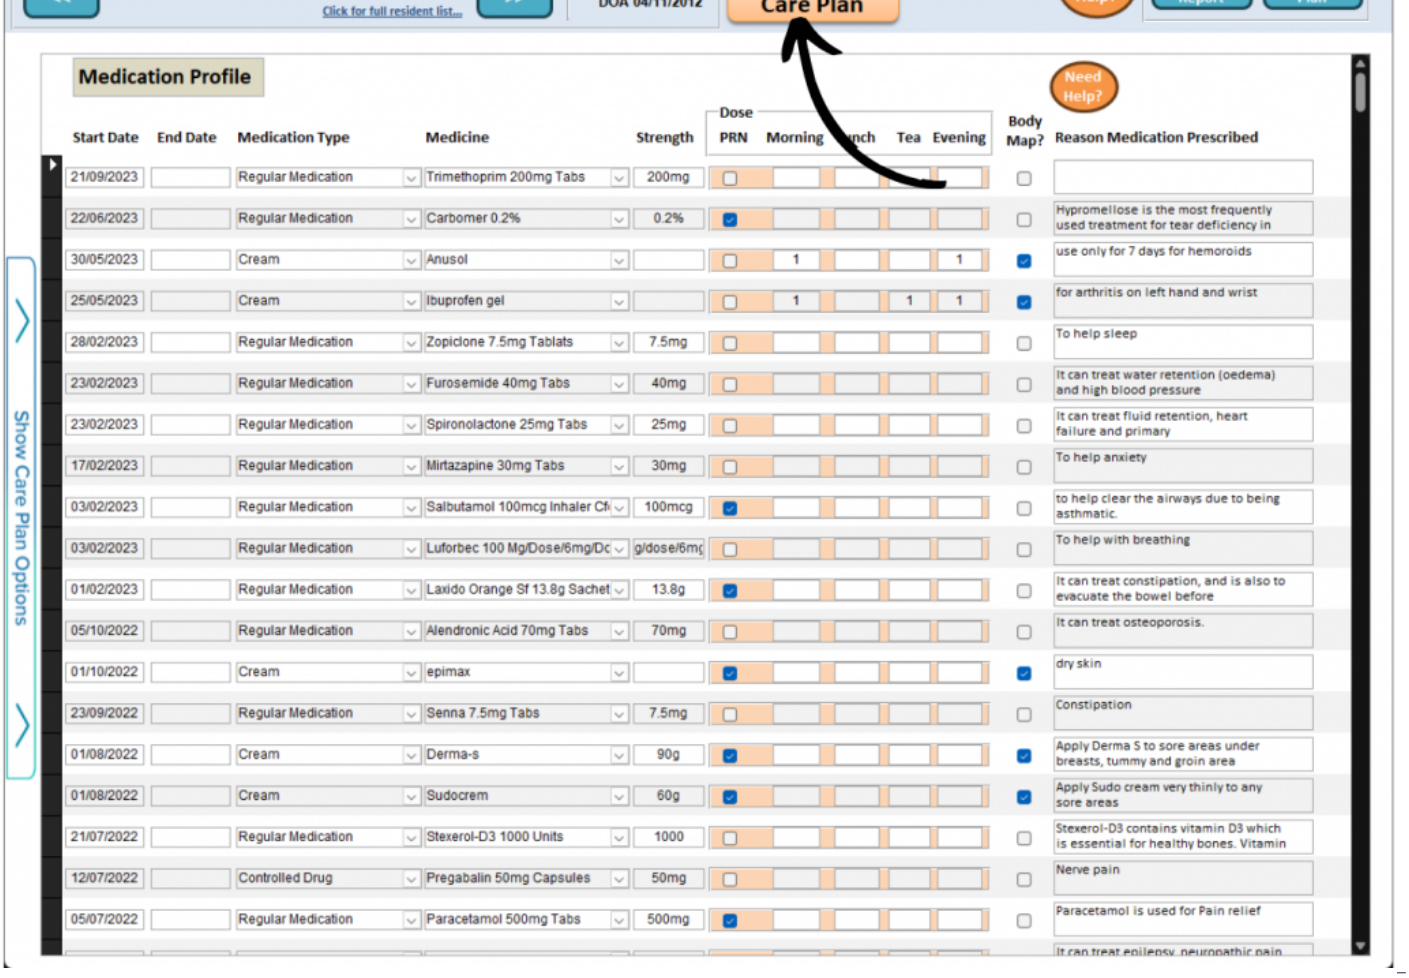
This guide will cover how to add medication to a service users medication profile via Care Control



1

In the Administration of Care Control Windows, navigate to the **Show Care Plans** tool, which can be found at the bottom of the window.





3

A list of currently documented medication will be displayed. To add a new one, press the **Click to Edit Care Plan** button.

4

Scroll to the bottom of the list. There should now be a blank row.

Begin by entering in the **Start & End Date** (if required). Then, select the **Medication Type** and **Medication** from the drop-down lists.

Enter the **Strength** and choose whether the medication is **PRN** or not. You can then enter the dosages at the different times of the day (Morning, Lunch, Tea, Evening).

Finally, choose whether a **Body Map** is required and enter a **Reason** for the medication.
