Integrated Windows Authentication

Advanced Stuff Windows · https://cclearninghub.co.uk/docs/integrated-windows-authentication/

Integrated Windows Authentication

This guide will cover how to access and configure the Windows Authentication for signing in to Care Control Windows. This tool allows for added security for Windows users.

1

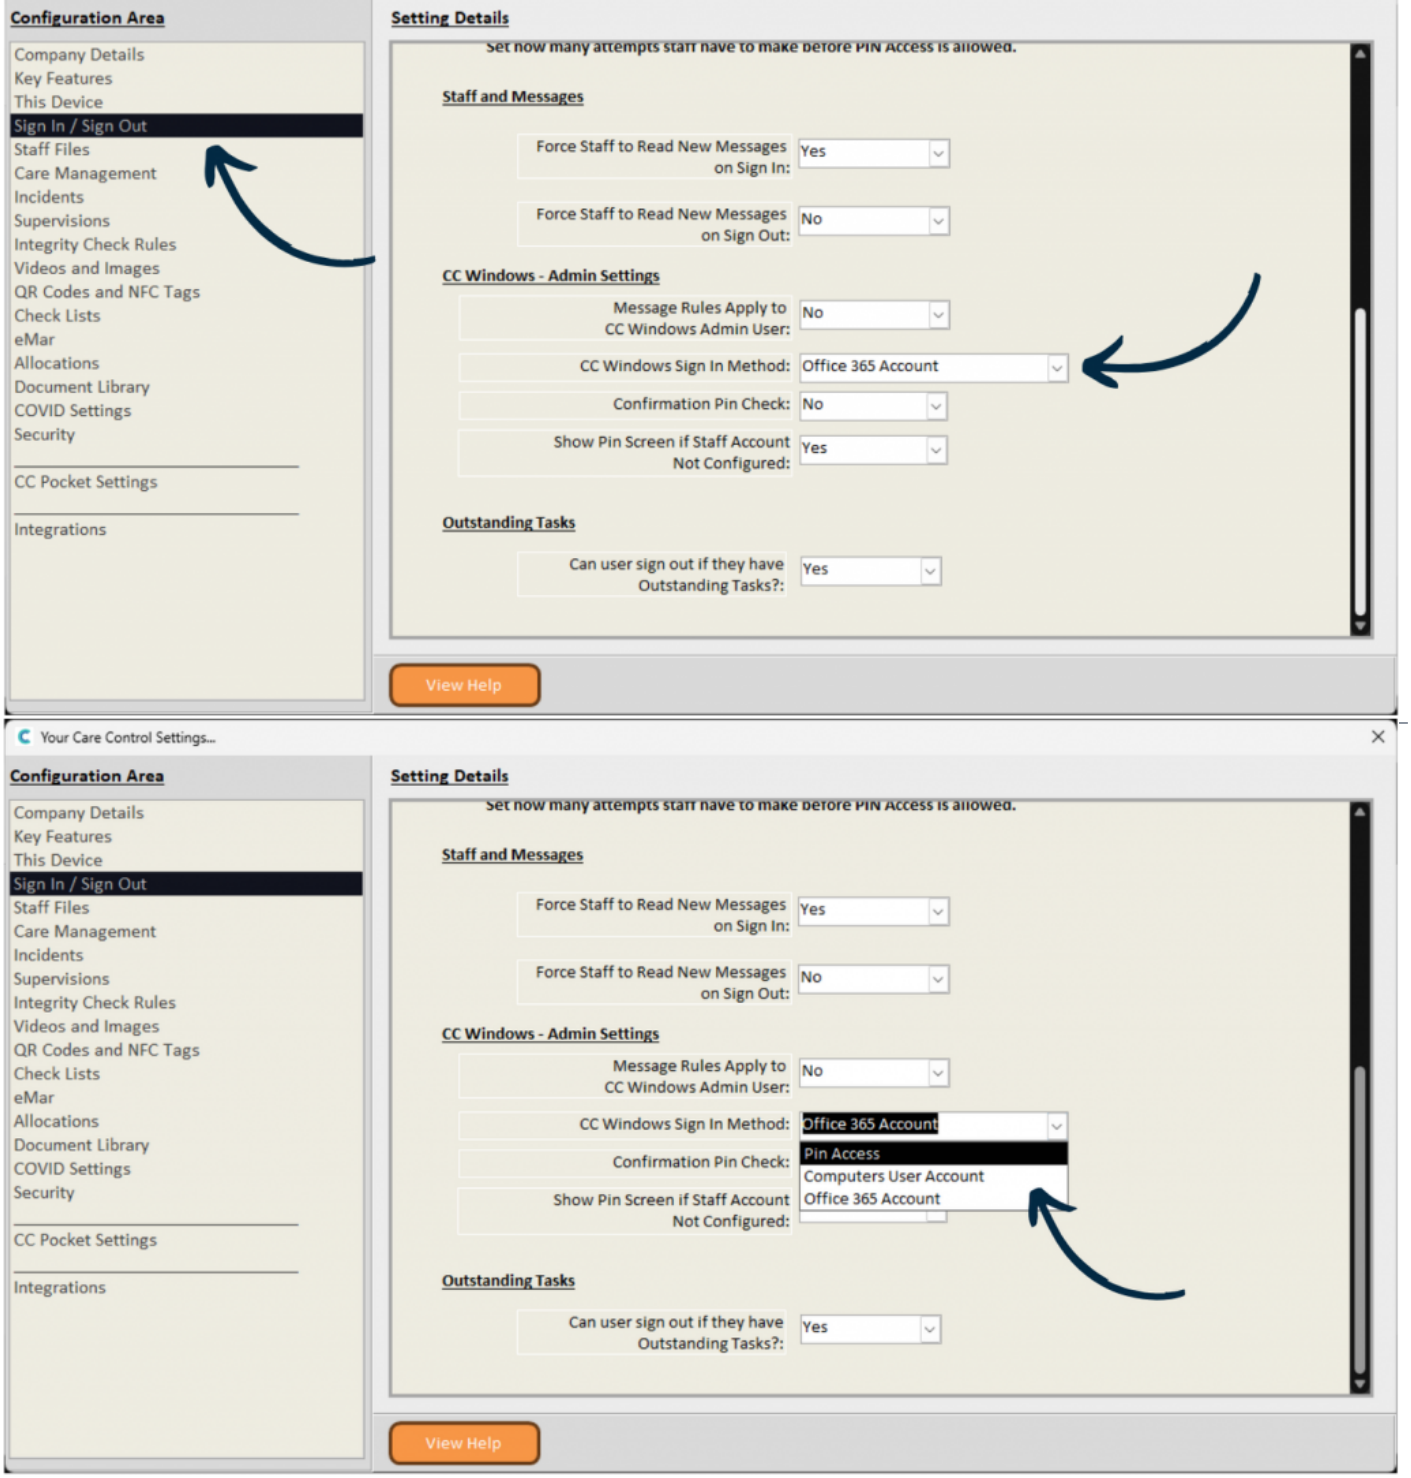

In the Administration of Care Control Windows, navigate to the **System Settings**, which can be found under the Advanced Stuff tab.

2

Here, select **Sign In / Sign Out** from the menu of options on the left hand side.

Here, under the '**CCWindows – Admin Settings**' are 3 options related to Windows Authentication.

The first option, '**CC Windows Sign In Method**' has 3 options.

3

– **PIN Access** – default option, requires a staff PIN to sign in.

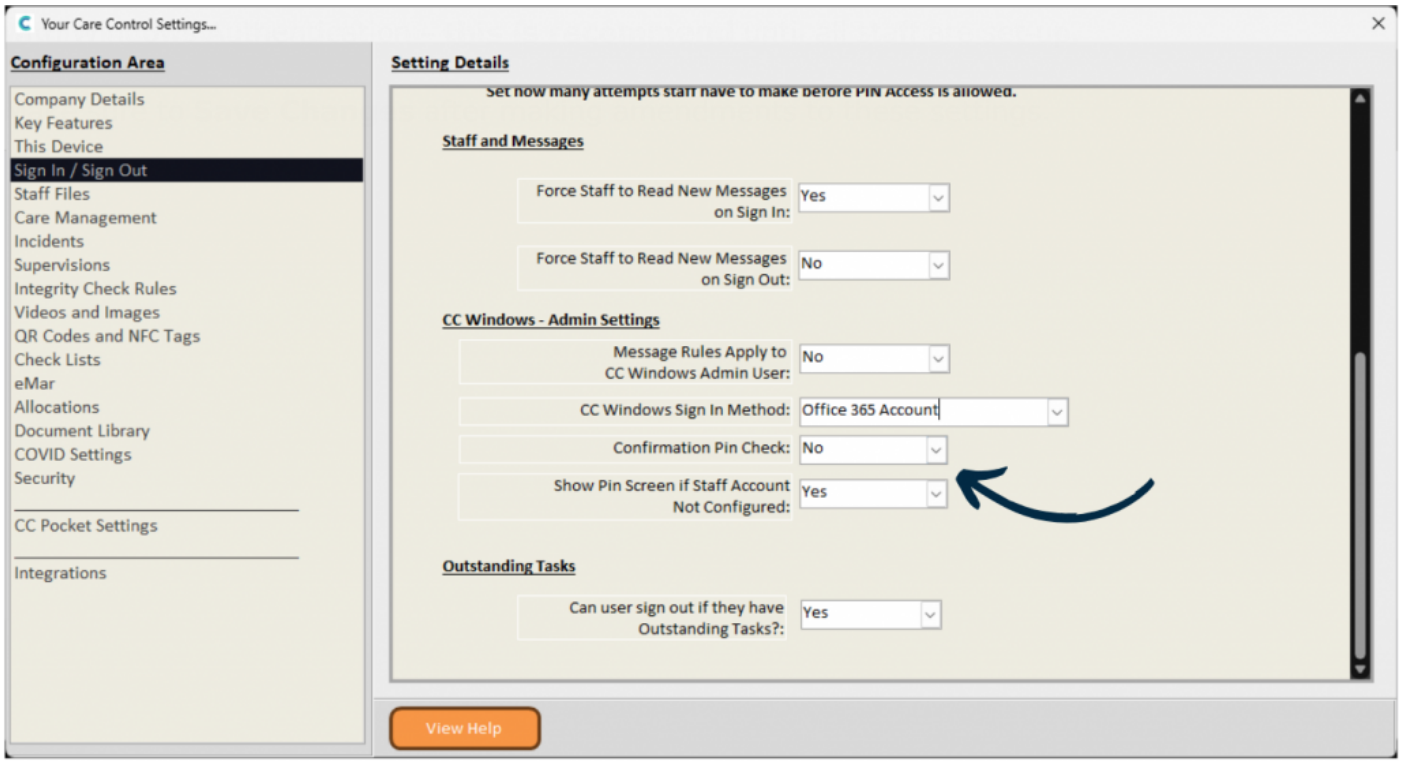

– **Computers User Account** – users will be linked to the computers user account.

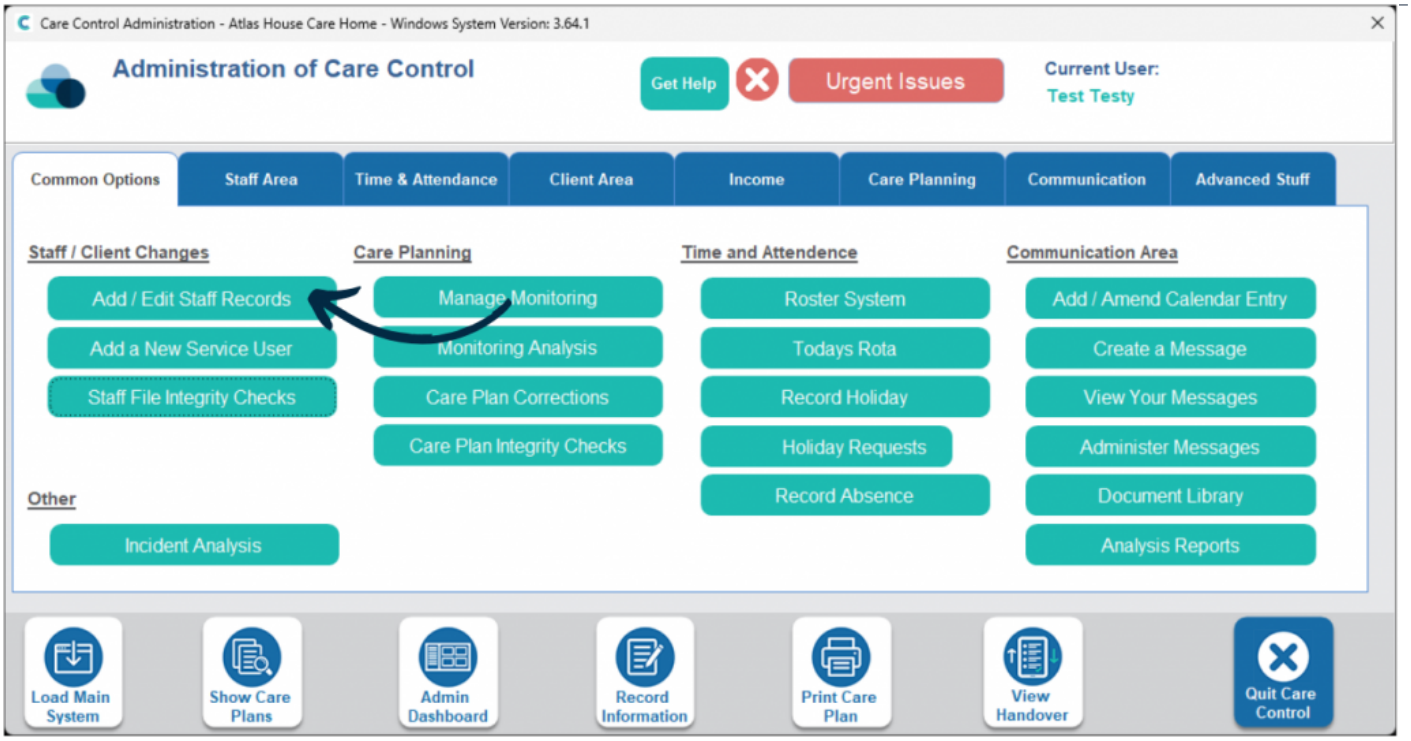

– **Office 365 Account** – users will be linked to an Office 365 Account associated with the computer.

4

– **Confirmation PIN Check** – when ‘Yes’ users will be asked for their PIN as well as being checked via Computer User / Office 365 Account.

– **Show PIN Screen** – when ‘Yes’, users will be able to log in if their user account is not configured

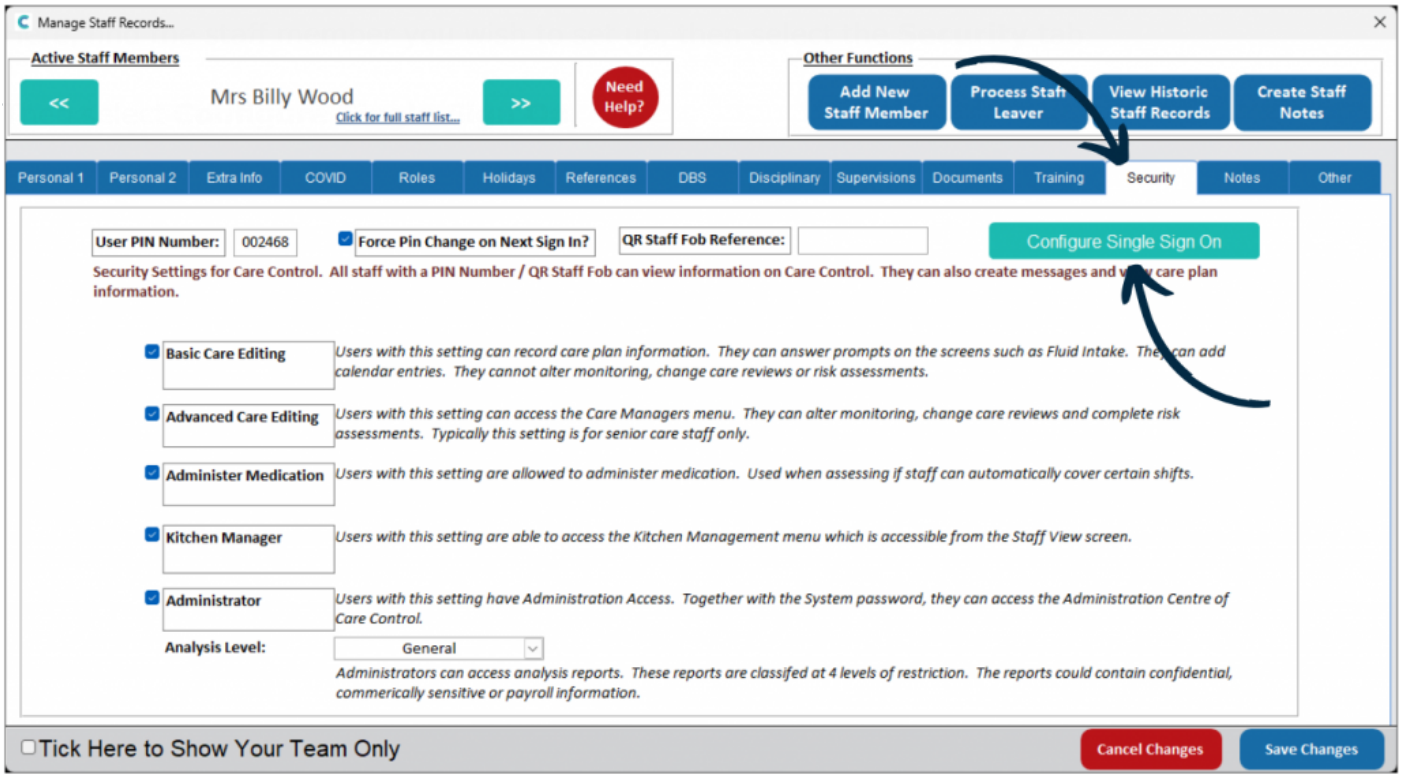

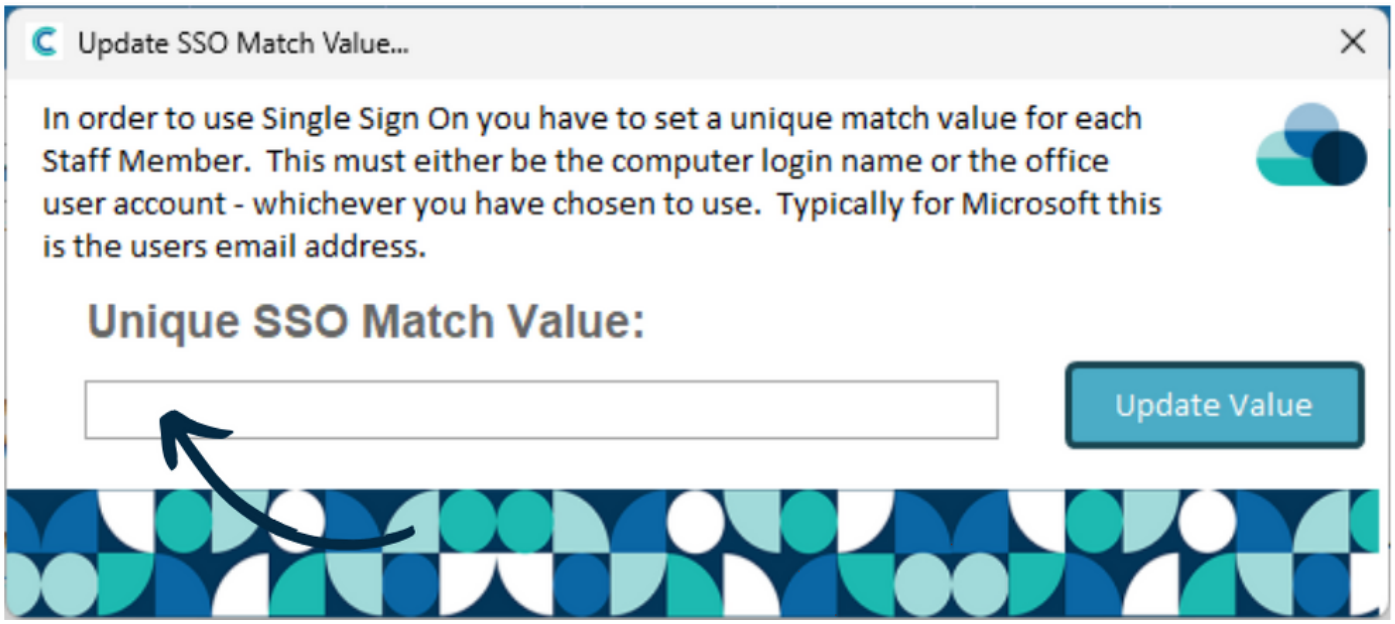

5

To configure a staff member with Windows Authentication, navigate to the **Staff Records**.

6

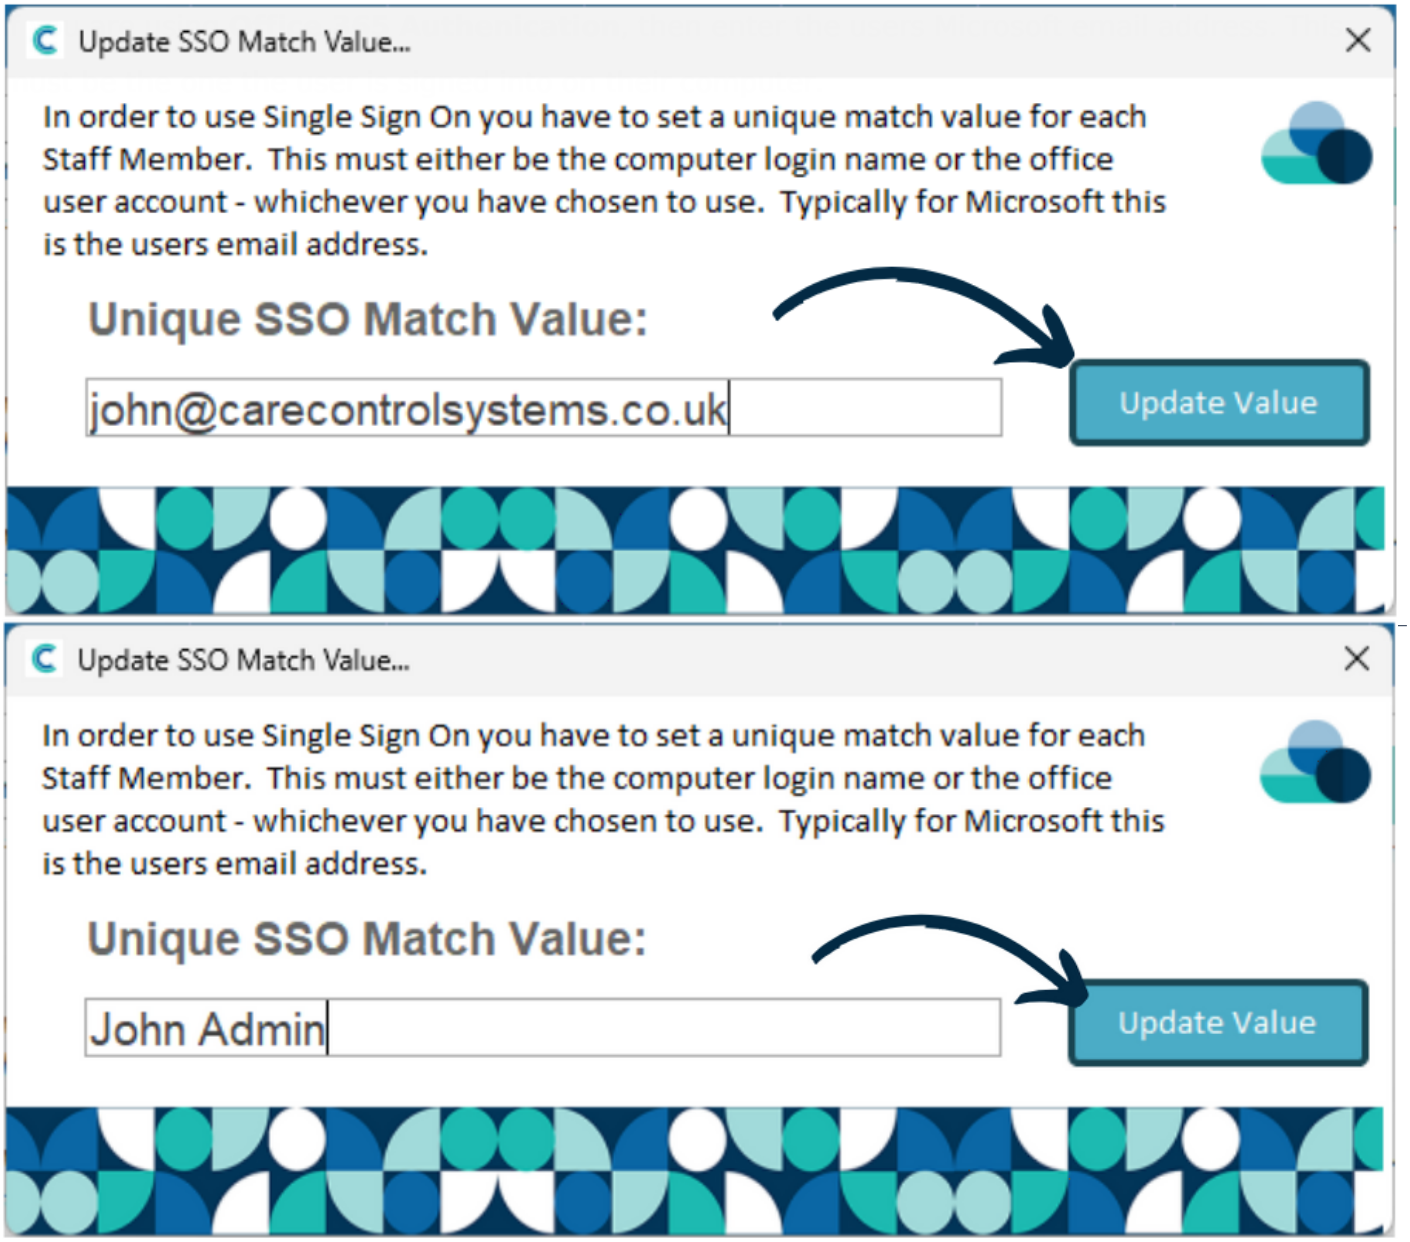

7

A new window will open. Here, enter the staff members unique user information. This is what the system will compare the information on the computer to – if they do not match, sign in will not be allowed.

8

9

If using **Computer User Authentication**, then enter the name of the user account on the computer. This is the name displayed when you first sign into your computer.

After entering the information, press **Update Value**.

FAQ's

Integrated Windows Authentication – how does it really work?

When Care Control is opened, it will check the computers User Account or Office 365 Account and then compare this to the staff records on Care Control. If there is a match, then the associated staff member will be signed into Care Control.

'**Confirmation PIN Check**' – should I use this option?

This option can be useful if multiple staff members use the same computer. If set to '**Yes**', when Care Control is launched and there is match between User Account / Office 365 Account and a staff member, their PIN will be required as well to confirm the user. If set to '**No**', if there is a match, the user will be signed straight into Care Control without requiring a PIN – this might be an issue if multiple staff members user the same computer.

'**Show PIN Screen if Staff Account not configured**' – should I use this option?

We recommend that this option is set to '**Yes**' until all Care Control Windows users have been configured. This will help prevent users being locked out. If this is set to '**No**', then if Care Control cannot match a computers User Account or Office 365 Account to any staff members, the system will not allow access.
